(ADAPTER)User Story 2 – Validate Incoming Request at Adapter

Story ID:US-ADAPTER-P2P-002
Actor: Adapter Integration
Goal: Validate incoming requests from IPL and respond immediately with validation outcome.
Business Value: Ensures only valid and well-formed messages are propagated to UCRM, reducing processing errors and improving reliability of the integration layer.
Referenced Diagram:UCRI 2.0 – P2P FlowDiagram (segment: “The Adapter validates the incoming request and immediately responds with either a validation error or a successful acceptance”).
Jira Ticket : IPL-26516: (ADAPTER) Validate Incoming Request at Adapter OPEN

User Story:

> As the Adapter Integration, I want to validate incoming requests from IPL and return an immediate validation response so that invalid messages are rejected early and valid messages can proceed to P2P authentication and forwarding.

Key Scenarios & Variations:

- Successful validation (all rules passed).
- Business-level validation failure at integration level (e.g., unsupported event type for this integration).
- Technical validation failure (e.g., JSON/XML schema violation).

Acceptance Criteria:

- Given an incoming request from IPL
  When the Adapter performs validation
  Then the Adapter must check at least: payload schema, mandatory fields, basic integration-level business rules (e.g., allowed event types), and authentication/authorization of IPL (if applicable).
- Given a request that passes all validation checks
  When validation completes
  Then the Adapter must respond to IPL with a successful acceptance status and a correlation identifier for tracking.

- Given a request that fails any validation rule
  When validation completes
  Then the Adapter must respond to IPL with a validation error, including a machine-readable error code and human-readable description.
- Given a request that cannot be parsed (e.g., invalid JSON/XML)
  When the Adapter attempts to validate
  Then the Adapter must return a parsing/format error without attempting P2P authentication or forwarding.
