(ADAPTER)User Story 4 – Forward Message from Adapter to UCRM via /messaging/send

Story ID:US-ADAPTER-P2P-004

Actor: Adapter Integration

Goal: Forward validated messages from IPL to UCRM using the P2P /messaging/send endpoint.

Business Value: Enables actual delivery of IPL events to UCRM for processing under UCRI 2.0 rules, with the Adapter acting purely as an integration component.

Jira Ticket: IPL-26518: (ADAPTER) Forward Message from Adapter <> UCRM via /messaging/send IN PROGRESS

User Story:

> As the Adapter Integration, I want to forward validated messages to the target UCRM using the /messaging/send endpoint so that UCRM can process them according to UCRI 2.0 rules.

Key Scenarios & Variations:

- Successful forwarding with valid token.
- Forwarding failure due to network issues or UCRM unavailability.
- Forwarding failure due to authorization issues (invalid/expired token).

Acceptance Criteria:

- Given a validated message and a valid token
  When the Adapter calls /messaging/send on UCRM
  Then the message must be transmitted with all required headers and payload intact, and UCRM must respond with an HTTP response that will be handled by US-IPL-P2P-005.
- Given a network or connectivity issue between Adapter and UCRM
  When the Adapter attempts to call /messaging/send
  Then the Adapter must apply a defined retry policy and, if retries fail, mark the message as undeliverable and return an appropriate error to IPL.
- Given an invalid or expired token
  When UCRM rejects the /messaging/send call due to authorization

Then the Adapter must attempt to re-authenticate via /token (per US-IPL-P2P-003) and retry sending, within configured limits.

- Given a message that cannot be delivered after all retries
  When the Adapter exhausts its retry policy
  Then the Adapter must log the failure, optionally persist the message for later reprocessing and notify IPL of the failure status.(if in scope).
